Team DART — Strategic Product Vision Slide Build Sheet

Purpose: Use this sheet after your assigned section in Anne-Marie's working document has been checked and updated. This is not another full write-up — it is only for deciding what should appear in the final 10–12 slide presentation.

How to use it: Under the slide(s) connected to your section, add only the most important points. Keep detailed evidence, tables and background in the working document or appendix.

Use these four questions for every slide
1. What is the one main message?
2. What evidence supports it?
3. What visual, table or example best shows it?
4. What detail can stay out of the main deck and move to the appendix?

> **How this sheet was filled**
>
> - Source: Strategic Product Vision working draft v0.1 (5 Nov 2026). Section references (§) point to that document. Nothing has been added that the working document does not support.
> - Yellow highlight = open item carried over from the working document (Section 8 log). Confirm it or take it off the slide before presenting.
> - Slides 7 and 8 were already filled by their section lead. Their text is unchanged; a cross-check note sits under each.
> - This sheet fixes the roadmap at Slide 8, so the working doc's outline slides 8–10 (prototype, requirements, usability) appear here as Slides 9–11.

Slide 1 – Title, team and context

Source: §1, §0 · Lead: Anne-Marie (Product Strategist)

Main message: Team DART presents the Strategic Product Vision for PRISM Requests (WORTS 2), a bounded Furniture Request Service on PRISM for the Government of Alberta.

Evidence

- Context line: the Government of Alberta directly manages more than 1,400 facilities. WORTS, the sole maintenance and furniture request service, is end of life and must be replaced. Our scope is the Furniture request journey.
- Team and roles: Anne-Marie (Product Strategist), Adekunle (Product Architect), Warren (AI Steward), Fuyang (Product Designer), Mmenyene (Project Manager), Qiuchen (Product Enablement Lead).
- Team DART · Queen's MDPM · Government of Alberta · 8 November 2026.

Visual: Title slide with the product name, a one-line context statement and the six team members with their roles.

Appendix: Nothing. The ownership table and review cadence are internal working material and stay out of the deck.

Open: Product name and CMAC definition for client-facing material (open item #1, Strategist, due 7 Nov).

Slide 2 – Problem: from replacing a tool to improving the Furniture service

Source: §2.1 · Lead: Anne-Marie (Product Strategist)

Main message: CMACs and other authorized requesters need a clearer and easier way to submit and follow Furniture requests, while Infrastructure staff need connected request information that supports both day-to-day service management and reporting.

Evidence

- WORTS is end of life and limited. Coordination happens in email and separate documents, so requesters chase updates and staff compile reports twice.
- The pain runs through the whole journey, not just intake: unclear requirements (Prepare); wrong pathway or missing information causing rework (Submit); status and timing hard to see (Review); conversations fragmented across channels (Fulfill); little feedback on the service (Close).
- Reframing: replacing a tool → improving the Furniture service; intake only → the full submit / follow / manage lifecycle; isolated records → connected information that also supports reporting.

Visual: Five-stage journey strip (Prepare → Submit → Review → Fulfill → Close) with the pain under each stage, and the three-row From → To reframing beside it.

Appendix: Full stage-by-stage table with design responses; DPO user journey.

Slide 3 – Users and job to be done

Source: §2.2–2.3 · Leads: Anne-Marie; Fuyang (personas); Qiuchen

Main message: The primary user is the occasional CMAC or authorized requester, who submits Furniture requests only now and then and does not build fluency with the system. Infrastructure coordination and Furniture staff are supporting users.

Evidence

- JTBD: "An occasional or authorized CMAC needs to understand requirements and submit a complete Furniture request (when a Furniture need arises) so it can be accepted and fulfilled without avoidable rework or repeat follow-up."
- Occasional CMAC (primary): unsure what is required; cannot see status or timing after submission; chases updates; approvals travel by email. Gains sought: simplifies, informs, avoids hassles, connects.
- Request Coordinator (supporting): keeps requests moving and resolves missing information; information is scattered across channels. Role definition to confirm; job is inferred.
- Furniture Coordinator / Team Manager (supporting): wants to process more requests with less duplicate coordination. The record of work lives outside the system, reports are compiled twice and workflow ownership is unclear.
- Sources: GoA-supplied interviews, JTBD, user journey, usability test (n=6 ministry staff, all existing WORTS users).

Visual: Three persona cards with the primary persona emphasised, and the JTBD statement as a banner across the top.

Appendix: Full persona table with the evidence source for each row.

Open: First-time CMACs are not yet validated. Label each persona point as evidence or inference.

Slide 4 – Vision and product concept

Source: §1, §2.4 · Lead: Anne-Marie (Product Strategist)

Main message: "Enable a Furniture Request Service that is simple to navigate, transparent where it matters and reliable across handoffs, so Government of Alberta requesters and Infrastructure staff can deliver and improve the service with greater confidence and accountability."

Evidence

- Target group: CMACs and other authorized requesters (primary); Infrastructure Furniture processing staff, coordination staff and Infrastructure management (supporting).

- Needs: clear submission guidance; meaningful progress visibility; knowing who is responsible and what happens next; reliable context during handoffs.
- Product: a guided request experience, meaningful progress and next actions, and relevant request history and operational information, on PRISM.
- Business goals: reduce avoidable submission rework and unnecessary follow-up; increase productivity; streamline processes; improve coordination and accountability. Guardrail: preserve governed access, accessibility and auditability.

Visual: Product Vision Board: the vision across the top, with Target group, Needs, Product and Business goals as four columns.

Appendix: Full elevator pitch (use as speaker notes); the vision board's "evidence so far" and "biggest unknowns" rows.

Open: Product name not decided. PRISM "appears capable" but is not confirmed (open item #3), so keep the wording from overpromising.

Slide 5 – Business opportunity and OKRs

Source: §3.1 · Lead: Anne-Marie (Product Strategist)

Main message: For a government service the return is avoided effort and added capacity, not revenue: easier requests for CMACs, less coordination effort for staff, and reporting from the same request data.

Evidence

- User value: easier requests and clearer visibility after submission. All 6 usability testers understood status.
- Business value: reduce avoidable coordination effort, increase Furniture service capacity and improve operational measurement (DPO business context; Cohen's suggested service KPIs).
- Technology value: reuse existing case data; shared status and ownership; reporting from the same information (DPO technical capability).
- Key results that already have a baseline: KR2 task completion without help, 14/24 attempts unaided (58%) target e.g. ≥ 80% in retest; confirm; KR3 status understanding, 6/6 in the prototype; KR6 visibility of volume, time open and delivery, not available today; KR8 governed-access guardrail, 100% of role rules enforced.

Visual: OKR table with three objectives (User, Business, Technology), each with its key results, baseline and target. Show open cells as "GoA data" or "TBD" rather than estimating them.

Appendix: Full OKR table with measurement methods; strategic alignment and market information rows.

Open: KR1, KR4 and KR5 baselines need GoA data (open item #6). KR7 baseline and most targets are TBD. Strategic-alignment source and market benchmarking are TBD.

Slide 6 – Product viability and risks

Source: §3.2, §4 top risks · Leads: Adekunle (tailwinds/headwinds); Mmenyene (risks)

Main message: The opportunity is viable as a bounded Furniture service. The DVO evaluation puts easier requests, clear communication and operations/reporting first, and the return can be quantified once GoA supplies baselines. The main risks are named, and each has an owner and a mitigation.

Evidence

- Real–Win–Worth It scores (1–5): priorities are DVO 1 Easier requests for occasional CMACs (3.8), DVO 2 Clear communication + visibility (3.9) and DVO 6 Operations + reporting (4.6). The outcome is DVO 4 Staff capacity (4.65); the condition is DVO 7 Maintainability + governed access (4.2).

- Tailwinds: WORTS end of life gives a clear mandate; PRISM appears capable of a bounded Furniture service; existing WORTS requests, status, comments and attachments can be reused; strong staff value in operations and reporting; the integration landscape is known (Outlook/email, SnapTracker, OneGX/SAP).
- Headwinds: workflow ownership and master data still open; first-time use untested; no Furniture-specific baselines; governed access and purchasing authority must stay valid; approvals still travel by email.
- Top risks (likelihood / impact → mitigation): workflow ownership / master data not settled (H / High → escalate to GoA as an explicit dependency); CMAC validation does not support our framing (M / High → treat as the next checkpoint); PRISM capability less than assumed (M / High → Architect to confirm with the PRISM team); no access to first-time users (M / Medium → secure introductions early).
- Return logic: avoided coordination effort, avoided rework, reporting time saved and capacity gained, each quantified once GoA baselines exist.

Visual: Tailwinds vs headwinds in two columns, a small ranked bar of the RWW scores with the priority DVOs highlighted, and the four risks as a likelihood / impact strip underneath.

Appendix: Full RWW table (DPO deck appendix F), including supporting DVOs 5 (3.5) and 3 (2.6); benefit-logic formulas and the GoA inputs they need; full headwinds list.

Open: Risk likelihoods still to be confirmed by the PM. Capability gaps (skills, capacity, budget) still to be added by the PM and Enablement Lead.

Slide 7 – Boundaries Conditions, Cost & Time

Source: §3.3 · Lead: Mmenyene (Project Manager) · Already filled; text unchanged

Implementation planning requires confirmed financial and delivery constraints. The team has identified the major implementation cost drivers, but cannot responsibly commit to a budget or delivery schedule without further validation.

Cost Considerations :

- Build and PRISM configuration
- System integrations
- Potential WORTS data migration
- Testing and accessibility
- Training, change and ongoing support

Budget envelope: Not confirmed

Time Considerations:

- WORTS end-of-life deadline: Unconfirmed
- PRISM configuration and integration effort: To be assessed
- Testing and adoption preparation: Required
- Implementation schedule: Subject to GoA validation

Delivery timeframe: Not confirmed

Cross-check against §3.3 (suggestions only)

- Consistent with §3.3: every cost estimate there is still a "$ range" placeholder, and the budget envelope and WORTS end-of-life date are open item #2 (PM, due 7 Nov).
- §3.3 lists "Run and maintain (annual)" (support, rule changes, role/authority upkeep, $/yr) as its own category. Consider showing it apart from the one-off costs.
- Data migration depends on a decision that is still open: migrate all WORTS history, or recent requests only.
- Title typo: "Boundary Conditions", not "Boundaries Conditions".
- **Visual:** a cost-category table with an "Estimate: to be confirmed with GoA" column. It shows the drivers without presenting guesses as facts, as §3.3 asks. **Appendix:** the basis/assumption for each category.

Slide 8 – Product Workplan and Roadmap

Source: §4 · Lead: Mmenyene (Project Manager) · Already filled; text unchanged

The product can progress through a phased approach, with further validation and foundational decisions preceding implementation. It will prioritise core capabilities and validations before enhancements.

01 · Finalize Vision : Incorporate usability findings and refine prototype

02 · Validate : Test with first-time CMACs and confirm workflows

03 · Refine : Update requirements, data model, and measures

Potential GOA Implementation Path

- Foundation
- Core Submit/flow
- Reporting
- Enhancements

Dependencies

- First-time CMAC access
- Workflow ownership
- PRISM feasibility
- GoA implementation resources

Cross-check against §4 (suggestions only)

- Steps 01–03 match the §4 horizons (Now → 8 Nov, Next, M2 close). In §4, step 03 also covers the ethics scan and setting KR baselines and targets.
- §4 says "core submit/follow" where the sheet has "Core Submit/flow". The whole GoA path is still an open item owned by GoA, so keep the word "Potential".
- §4 also lists baseline data from GoA, funding and the WORTS end-of-life date as dependencies, and says AI comes only after foundations.
- Dates we can show: usability testing 21–29 Oct 2026 (complete); SPV and prototype submission 8 Nov 2026; final PRD and handover 26 Nov 2026. The next-iteration and first-time CMAC retest dates are not set, and the retest depends on GoA.
- **Visual:** a horizon timeline (Now → Next → M2 close → Beyond M2) with the milestone dates and the dependencies drawn as gates. **Appendix:** the full workplan table with owners, and the full risk table.

Slide 9 – Prototype video and guiding scenarios

Source: §6 · Lead: Fuyang (Product Designer)

Main message: Guide the request before it is submitted, then make next steps, ownership and progress legible. The three-minute prototype video shows this through two guiding scenarios.

Evidence

- Scenario 1, Requester (usability tasks 1–2): an occasional CMAC understands what is required, submits through the guided form with auto-filled building details, checks status and responds to a request for information. Rationale: less uncertainty at preparation and submission; visible status builds trust.
- Scenario 2, Furniture coordinator (tasks 3–4): spots a blocked request, messages the requester inside the request, builds a quote with photos, specs and cost split, previews what the client sees and sends it. Rationale: one record for coordination and reporting; fewer channel switches.
- In scope: guided submission and review; shared status, owner and next step; in-request messaging, quotes and approvals; operational reporting from the same case data; governed access and audit. Out of scope or later: maintenance requests (broader WORTS replacement), AI capabilities (feasibility option only), procurement process redesign.

Visual: The three-minute video: 0:00–0:30 problem and users; 0:30–1:40 Scenario 1; 1:40–2:30 Scenario 2; 2:30–3:00 rationale and what testing changed. Add an in-scope / out-of-scope strip, and label the prototype as using fictional names, costs and dates.

Appendix: MoSCoW backlog with release mapping; video script.

Open: Confirm the other scope exclusions. Video segment owners (Designer) still to confirm.

Slide 10 – Requirements, data and ethics highlights

Source: §5, §7.1 · Leads: Fuyang (§5.1); Adekunle (§5.2); Warren (§5.3, §7.1)

Main message: Every requirement traces to usability or DPO evidence. One connected case record serves submission, status, operations and reporting. Every ethics point drives a design decision, and controlled decisions stay with authorized people.

Evidence

- 15 functional requirements: 10 Must, 3 Should, 2 Could. Headline Musts: guided form with a one-page review (FR-01); auto-fill with a visible “auto-filled” cue (FR-02); status with owner, next step and overdue flag (FR-05); messaging inside the request (FR-06); role-based access and purchasing authority (FR-12); reporting from the same case record (FR-13).
- Non-functional guardrails: accessibility; governed access; auditability (100% of case events logged); privacy; rules and roles configurable without redevelopment; integration with Outlook/email, SnapTracker and OneGX/SAP.
- Data principles: capture the request once; keep the record of work inside the case; report from the same data, not a second compilation; give master data (locations, roles) a named owner.
- Ethics (MDPM 850): collect only what is needed and use role-based access; show requesters their progress while keeping internal notes restricted; make clear that sharing a proposal is not approval; report at service level, with no individual staff ranking by default; keep purchasing and proposal decisions with authorized people.
- Emerging technology (MDPM 822): did not support production AI at this stage. The improved non-AI workflow is the foundation. Human-supervised AI stays a future option, only if it shows value beyond that baseline.

Visual: One-page system map: the Request (case) record at the centre, linked to requester, location, item/quote, messages, approvals and status events, which feed reporting. Integrations (Outlook/email, SnapTracker, OneGX/SAP) sit at the edge, with three ethics callouts tied to their requirements.

Appendix: Full FR and NFR tables; data model table; full ethics scan; MDPM 822 technology options comparison.

Open: Reconcile the PRD tables with the MDPM 883, 830, 850 and 822 outputs before final (open item #7, due 8 Nov). The MDPM 883 spec numbers its requirements FR-01 to FR-26, so keep FR numbers off the slide until they are reconciled. NFR thresholds (accessibility standard, security classification, privacy requirements) are to be confirmed with GoA. Data sources are to be confirmed (role directory, facility master data owner, SnapTracker, OneGX/SAP).

Slide 11 – Usability results and planned changes

Source: §7.2, §3.4 · Leads: Fuyang (§7.2); Qiuchen (§3.4)

Main message: All 24 task attempts were completed and the core design worked, but only 14 were unaided. Four major issues (none critical) set the next iteration, and first-time CMACs are still untested.

Evidence

- Six remote moderated sessions, 21–29 Oct 2026, with GoA accommodation and facilities staff, all existing WORTS users: 24/24 attempts completed (14 unaided, 10 with moderator help); mean ease 3.75/5. Some of the help concerned the test materials, so this is not a confirmed success rate.
- By task (unaided / with help / ease): submit a request 2 / 4 / 4.00; check progress 4 / 2 / 3.83; blocked request 4 / 2 / 3.67; share a quote 4 / 2 / 3.50.
- What worked (keep): guided, uncluttered form; auto-filled building details; status and messaging in one place.
- Four major issues → planned changes: date language unclear (4 of 6) → “Date required on site” with a suggested date and reason (FR-04); status dates hard to read (3 of 6) → last updated, requested vs confirmed timing, overdue flag (FR-05); proposal too thin to share (4 of 6) → images, specs, matching, cost split, lead time against required date (FR-08); cannot preview what the client sees (2 of 6) → client-facing preview, extra recipients, PDF download (FR-09).
- Limits: no first-time users; fictional prototype data; small sample; one complex request not tested.
- Close with what GoA must put in place (§3.4, GoA owner Cohen). Already requested: approval reminder rules per request type (4 of 6 testers still handle approvals by email); first-time CMACs for the next test round. Still open: an owner for the Furniture workflow and master data; a role and purchasing-authority upkeep process; a training and contextual-help plan (4 of 6 wanted help for first-time users).

Visual: An issue → planned change → requirement table for the four major issues, beside a small unaided vs with-help bar for each task.

Appendix: Minor issues and the full usability report; method details.

Notes for the team

Things to settle before the slides are built

- **Slide order.** The roadmap sits at Slide 8, but its step 01 (“incorporate usability findings”) comes before the audience sees those findings on Slide 11. Consider moving the roadmap to the end so the deck closes on next steps and the GoA asks (the working doc’s §9 outline pairs them).
- **Minor-issue count.** §1 says four major and eight minor issues. §7.2 lists eight minor issues plus another seven. Agree one number before it goes on a slide; until then, show only the four major issues.
- **Requirement numbering.** The working doc’s FR-01–FR-15 do not match the MDPM 883 spec’s FR-01–FR-26 (for example, MDPM 883 FR-05 is “save a draft”, not the status view). Reconcile this under open item #7 before any FR number reaches a slide.
- **§5.3 wording.** The fifth ethics row is labelled “Privacy and data reuse / Accessibility and fair participation” but only describes accessibility, and its risk cell starts with the typo “sOccasional”. AI Steward to tidy.
- **Open items that block slide text (§8):** #1 product name and CMAC definition; #2 budget envelope and WORTS end-of-life date; #3 PRISM capability and integration approach; #6 GoA baselines; #7 PRD reconciliation. Items #4, #5 and #8 are the GoA asks on Slide 11.
